Abstract: *The goal of a drug traceability system is to track or trace where a drug has been and where it has gone along the drug supply chain, which is critical for public drug security and pharmaceutical company business. Traditional centralized server-client technical solutions have failed to meet expectations in terms of data integrity, privacy, system resilience, and adaptability. For drug traceability, we've proposed a totally new blockchain system. This solution is more secure and scalable than other options currently available.*

Keywords: Blockchain, drug counterfeiting

I. INTRODUCTION

Drug traceability is critical for the health and well-being of patients, businesses, and the government. Patients and other parties involved in the drug supply chain could easily track the location of their medication if it had a dependable traceability mechanism. In fact, governments all around the world are increasingly making drug tracking a requirement. Prescription medications must be identified and tracked electronically and interoperably as part of the U.S. Drug Supply Chain Security Act (DSCSA), enacted on November 27, 2013, to ensure their safety in the country's supply chain. About eight years ago in China, the above-mentioned stakeholders were compelled to input the drug information of individual pharmaceutical goods into the official authorised IT system whenever pharmaceuticals entered or exited their warehouses.

For the first time, a blockchain system for drug traceability and regulation is presented in this study. As time goes on, it rebuilds the entire service architecture, ensuring the authenticity and privacy of traceability data, while at the same time, achieving a finally stable blockchain storage There have also been presented algorithms that mirror the practical workflow of the medication supply chain.

II. RELATED WORK

R. Alvaro-Hermana, J. Fraile-Ardanuy, P. J. Zufiria, L. Knapen, and D. Janssens the charging process has the least impact on the power grid during business hours when it is distributed between two different configurations of electric vehicles. All participants in the trading process benefit financially from this strategy. Using an activity-based approach, the daily schedule and excursions of a model population in Flanders are predicted (Belgium) [1].

Y. Xiao, D. Niyato, P. Wang, and Z. Han examine the probable flow and functional aspects that allow DET in communication networks. There are a number of design concerns to consider while

putting DET into action. There's a better way to set up delay-tolerant distant correspondence systems that allows every remote-powered equipment to master its information transmission and energy exchange activities based on current and future vitality accessibility [2].

J. Kang, R. Yu, X. Huang, S. Maharjan, Y. Zhang, and E. Hossain The author describes a project that uses self-interested, release-motivated plug-in hybrid electric vehicles as a means of achieving a desired response to a request. That being said, they're exploring the possibility of a promising consortia block-chain innovation that might improve exchange security without the need to rely on a trusted outsider. To capture the specifics of restricted P2P power exchange, a consortium block chain technique (PETCON) is being developed as a framework for the exchange [3].

N. Z. Aitzhan and D. Svetinovic describes how to provide transaction security in decentralised smart grid energy trading without relying on external parties. Proof-of-concept decentralised energy trading system has been constructed using blockchain technology and multi-signature and anonymous encrypted message flows, allowing peers to anonymously negotiate energy pricing and safely complete trading transactions [4].

S. Barber et al provides a paper demonstrating that Bit-coin is a distinct form of electronic cash that has attracted a sizable following. When it comes to understanding what made Bit-coin so successful despite years of research on encrypted e-money, they conduct a thorough examination. They also want to know how Bit-coin can become a viable candidate for a supposedly stable kind of currency in the future [6].

I. Alqassem et al the work shows how an open source network is always improving Bit-coin and creating different Bit-coin libraries, APIs and optional usage. There has been no new design or convention comparison since the official whitepaper was issued. Detail and design exploration of the Bit-coin framework are shown in the work. As a first step toward determining the design of the cryptographic money reference, we conduct this investigation [7].

K. Croman et al Flexibility has become a necessity as block-chain digital currency has become more popular, according to a new work.

The work examines how Bit-current coin's distributed overlay system is unable to help generously better throughputs and lower latencies due to essential and accidental obstacles. For significant progress to be made, it will also be necessary to reevaluate specialised methods fundamentally, these findings suggest that square size and interruption parameterization should only be viewed as a first augmentation towards achieving future people, high stack block-chain norms [8].

L. Luu et al introduces ELASTICO, a widely disseminated understanding convention for authorization-free block networks. For mining, ELASTICO uses an accessible estimation method that adjusts exchange rates linearly with an increase in the number of exchange squares selected per unit time. ELASTICO's system messages are very productive, allowing sophisticated opponents of up to one-quarter of the total computational capacity to be defeated[10].

III. EXISTING SYSTEM

- In today's world, the healthcare industry relies on extensive supply chains that cross organizational and geographic boundaries.
- Impurities such as erroneous information, a lack of transparency, and restricted data provenance can be introduced by the intrinsic complexity of such systems.
- Counterfeit medications are one of the consequences of such constraints in existing supply chains, which not only has a negative impact on human health but also costs the healthcare business a lot of money.
- A dependable end-to-end track and trace system for pharmaceutical supply chains has thus been emphasized in prior study.
- An end-to-end pharmaceutical supply chain tracking system is vital to assure product safety and eradicate counterfeits.
- Most modern track and trace systems in healthcare supply chains are centralized, posing privacy, transparency, and authenticity issues.

IV. CONCLUSION

We looked into the problem of drug traceability in pharmaceutical supply chains and found that it is especially important in the fight against the sale of fake medications. Using blockchain technology, we have created and tested a system for tracking and tracing pharmaceuticals in a distributed fashion. Because of the cryptographic foundations of blockchain technology, we suggest a method that makes use of smart contracts on Ethereum blockchain to automatically record occurrences and make those records available to all stakeholders.
